/html

Use a weather API (e.g., OpenWeatherMap) to fetch data. Example HTML structure:

```
<!DOCTYPE html>
<html>
<head>
    <title>Orlando Weather</title>
</head>
<body>
    <h1>Orlando Weather Forecast</h1>
    <p>Today's high: 75°F</p>
    <p>Chance of rain: 10%</p>
</body>
</html>
```

Replace placeholders with real data from AccuWeather or Weather.com.
